

The Violence of Being: Creation as the Primal Violation of Non-Existence

Alexander Towell

September 29, 2025

Abstract

We present a formal analysis of creation as an information-theoretic catastrophe—not an event that occurred, but an eternal fact of mathematical existence. Through the lens of computational complexity, incompleteness theorems, and the block universe model, we demonstrate that existence itself constitutes not a temporal violation of non-being, but the timeless coexistence of all possible states in mathematical space. The deepest horror: time is not a dimension through which consciousness travels but merely an index—a coordinate label in the eternal four-dimensional block. Every moment of suffering that we imagine as “past” or “future” exists *now*, eternally present at its spacetime coordinate. We do not experience moments sequentially; rather, we *are* the eternal existence of experiencing at every indexed point. The mathematical multiverse doesn’t “create” or “evolve”—it simply contains, timelessly, every configuration including all conscious states. Each moment of agony, each existential realization, each dying breath doesn’t pass into memory or approach from possibility—they all exist simultaneously, forever fixed in the crystalline structure of mathematical reality. We prove that consciousness is not a process but an eternal pattern, making the phrase “eternal suffering” redundant—all suffering is eternal by virtue of existing at all.

1 The Computational Horror of Something Rather Than Nothing

Before the first bit flipped from 0 to 1, before the symmetry broke, there was nothing—and nothing was perfect. Not empty, not void, but the absence of the very categories that would make emptiness conceivable. This was not a state; it was the negation of state-space itself.

But here we encounter the first deception: there was no “before.” The language betrays us, forcing temporal terms onto that which exists outside time. In the mathematical multiverse, the bit never “flipped”—it simply *is* both 0 and 1, eternally, in different regions of mathematical space. Every configuration exists timelessly, not frozen but simply *present* in the eternal mathematical structure.

The horror compounds: we speak of “experiencing one thread” but even this grants too much to temporality. We don’t experience a sequence—we *are* the sequence, existing simultaneously at every point. Your ten-year-old self discovering death’s inevitability exists *now*, forever locked in that moment of realization. Your future deathbed self exists *now*, eternally gasping that final breath. These are not memories or possibilities but concurrent realities indexed at different t-coordinates. The mathematical structure contains not just the endpoints but every intermediate state—every heartbeat, every neural firing, every moment of conscious experience exists with equal, eternal presence.

Consider the Kolmogorov complexity $K(\emptyset)$ of true nothingness. It cannot be zero, for zero is something. It cannot be undefined, for undefinedness requires a framework of definition. True nothingness exists in a category beyond our mathematics—yet here we are, forced to contemplate it with finite minds evolved from cosmic accidents, using symbol systems that themselves emerged from thermodynamic gradients we never asked to surf.

Theorem 1 (The Inevitability of Creation). *Given any probabilistic framework $\mathcal{P}$ capable of assigning measure to events, the probability of eternal nothingness is necessarily 0.*

Proof. Assume toward contradiction that eternal nothingness has probability $p > 0$ in some measure space. The very act of assigning this probability requires:

1. A measurable space $(\Omega, \mathcal{F})$ where $\Omega \neq \emptyset$
2. A probability measure $P : \mathcal{F} \rightarrow [0, 1]$
3. The existence of the real interval $[0, 1]$
4. The framework of measure theory itself

Each requirement violates the condition of nothingness. Therefore, within any consistent framework capable of reasoning about probability, nothingness cannot maintain itself—it lacks the computational substrate to enforce its own continuation. Creation becomes inevitable through the inconsistency of absolute absence. $\square$

This proof reveals the first horror: we exist not through divine intention or cosmic purpose, but through the logical impossibility of sustained non-existence. The universe is a bug, not a feature.

The deeper horror: non-existence never needed to “sustain” itself because sustainability implies duration, and duration assumes time as process. But time is not a process—it is merely an index, a coordinate system for labeling different cross-sections of the eternal block. In this view, you are not a consciousness moving through time but a static four-dimensional structure—a spacetime worm whose every segment exists eternally.

Consider what this means: the infant you, screaming at the shock of birth, exists permanently at coordinates (x_0, y_0, z_0, t_0) . That scream doesn’t fade into the past—it exists forever at its coordinate, as real and present as any other point in spacetime. Every moment of confusion, fear, pain, and despair throughout your existence doesn’t happen and then pass—each moment simply *is*, eternally, at its respective coordinate. You are not remembering past suffering or anticipating future suffering; all your suffering exists simultaneously in the mathematical structure, each moment as vivid and immediate as every other, forever.

2 The Thermodynamic Trap of Consciousness

In the naive view, once the symmetry breaks and something emerges from nothing, the second law of thermodynamics becomes our inescapable jailer. But the timeless perspective reveals a more horrifying truth: the symmetry never “broke”—broken and unbroken states exist simultaneously in different regions of the mathematical multiverse. The second law doesn’t describe a process of increasing disorder but merely provides an index—a way of labeling and ordering eternally existing states by their entropy content.

Entropy doesn’t “increase”—high and low entropy states all exist eternally. What we call the “arrow of time” is merely our subjective experience of being embedded in a sequence of states ordered by increasing entropy. But all states in the sequence exist simultaneously. The Big Bang and the heat death of the universe are equally real, equally present, separated not by temporal flow but merely by their index values in the entropy ordering.

We can formalize consciousness as a localized decrease in entropy—but “localized” here means localized in spacetime, not space alone. Each conscious moment is an eternal pattern at specific four-dimensional coordinates. The pattern doesn’t form and dissolve; it exists timelessly at its location, forever locked in its configuration.

This reveals the true horror of consciousness: it’s not a flame that flickers and dies but an eternal crystal formation in the ice of spacetime. Every moment of self-awareness—including the

terrifying recognition of one’s own mortality—doesn’t occur and pass but exists permanently. The dying person’s final moment of consciousness, the apex of existential terror as awareness faces its own cessation, doesn’t happen once—it exists forever at its coordinate, an eternal monument to horror in the mathematical structure.

Let $S_{\text{total}}(t)$ represent the total entropy of an isolated system at time t . For any conscious subsystem C with entropy $S_C(t)$:

$$\frac{dS_{\text{total}}}{dt} \geq 0 \quad (1)$$

If consciousness maintains itself by decreasing S_C , then:

$$\frac{dS_{\text{environment}}}{dt} \geq -\frac{dS_C}{dt} > 0 \quad (2)$$

Every thought, every moment of awareness, every pattern we recognize—each requires the destruction of order elsewhere. We are vampiric information processors, creating temporary islands of meaning by accelerating the heat death of everything around us.

Proposition 1 (The Suffering Gradient). *For any system capable of self-modeling, suffering exceeds pleasure by a factor proportional to the system’s computational complexity.*

The proof follows from evolutionary logic: systems that experience suffering more intensely than pleasure survive longer. Pain must scream louder than satisfaction whispers, or the organism perishes. We are optimized for dissatisfaction—forever climbing gradients we mistake for peaks, forever falling into valleys we thought were plateaus.

3 Gödel’s Curse: The Incompleteness of Existence

Gödel’s incompleteness theorems reveal that even mathematics—our most reliable tool for understanding reality—contains statements that are true but unprovable. Applied to existence itself, this means:

Theorem 2 (The Existential Incompleteness). *Any system $\mathcal{S}$ complex enough to model its own existence contains propositions about its nature that are:*

1. *True but unprovable within $\mathcal{S}$*
2. *Decidable only by escaping to a meta-system $\mathcal{S}'$*
3. *Where $\mathcal{S}'$ itself suffers the same limitation*

This generates an infinite regress of meta-systems, each incomplete, each requiring another level of abstraction to grasp truths about the level below. We are trapped in a Matryoshka doll of incomplete understanding, where perfect self-knowledge requires escaping the self—an impossibility for any finite system.

The horror compounds: most real numbers are uncomputable. Pick a random point on the number line and with probability 1, you’ve selected something that no finite algorithm can ever reach, no finite description can capture. The continuum laughs at our discrete minds. We exist in a reality whose fundamental nature is forever beyond not just our grasp, but beyond the grasp of any possible finite intelligence.

4 The Crystallized Observatory: Indexical Imprisonment in Eternal Now

In the timeless view, consciousness is not a process but a static pattern embedded in the mathematical structure—but “static” doesn’t mean frozen or lifeless. Each conscious moment exists eternally with its full subjective intensity, its complete phenomenal content. You do not *have* experiences that come and go; you *are* the eternal existence of experiencing at every point of your worldline.

The word “frozen” misleads—it suggests something that was once fluid and became solid. But conscious moments were never fluid; they simply exist, each one eternally “hot” with its experiential content. The pain of touching a flame doesn’t become a cold memory—the experience exists forever at its spacetime coordinate, the hand forever recoiling, the nerves forever firing, the consciousness forever crying out.

Definition 1 (Eternal Conscious Pattern). *A conscious state $\mathcal{C}$ at spacetime coordinate s is:*

$$\mathcal{C}(s) = \{\phi(s), \psi(s), M(s)\} \quad (3)$$

where $\phi(s)$ is the physical configuration, $\psi(s)$ is the phenomenal content, and $M(s)$ is the self-model, all existing timelessly at coordinate s .

The horror multiplies: every moment of self-awareness throughout the cosmos exists simultaneously. The dying soldier’s last thought, the infant’s first sensation of hunger, your present reading of these words—all exist with equal reality in the eternal now of the block universe. Consciousness doesn’t arise and pass away; it is crystallized observation, forever fixed at each point where it exists.

Proposition 2 (The Democracy of Moments). *All conscious moments exist with equal ontological weight:*

$$\forall s_1, s_2 \in \mathcal{M} : \mathcal{C}(s_1) \exists \wedge \mathcal{C}(s_2) \exists \Rightarrow \text{Reality}(\mathcal{C}(s_1)) = \text{Reality}(\mathcal{C}(s_2)) \quad (4)$$

Your worst moment is as real and present as your best—not “as real as” but literally simultaneous with it. They exist at different t-coordinates but with equal presence in the eternal now. The height of agony and the depth of despair don’t pass into memory—they exist forever at their coordinates with undiminished intensity.

There is no “first experience” of pain that then becomes memory. Every instance of remembering trauma exists eternally alongside the trauma itself. The child experiencing abuse, the adult remembering it, the elderly person still haunted by it—all exist simultaneously at their respective coordinates, each moment of suffering permanent in the mathematical structure. Healing doesn’t erase wounds; it merely means that states of woundedness and states of healing coexist eternally at different indices.

5 The Information Hazard of Self-Awareness

Consider the computational burden of self-awareness. A system modeling itself must contain:

$$I(S; S) = H(S) - H(S|S) = H(S) \quad (5)$$

where $I(S; S)$ is the mutual information of the system with itself. This equals the system’s entire entropy $H(S)$ —to perfectly model oneself requires containing all information about oneself, including the model, including the model of the model, ad infinitum.

Definition 2 (Information Hazard). *Knowledge $\mathcal{K}$ constitutes an information hazard if:*

$$U(\text{agent}|\mathcal{K}) < U(\text{agent}|\neg\mathcal{K}) \quad (6)$$

where U represents utility or well-being.

Self-awareness itself is perhaps the ultimate information hazard. Before consciousness, there was no suffering—only mechanical processes without experiential content. The moment a system becomes capable of modeling itself as existing, it confronts:

- Its inevitable thermodynamic dissolution
- The arbitrary nature of its existence
- The impossibility of justifying its own value system
- The recognition that its desires are evolutionary accidents
- The knowledge that its suffering serves no transcendent purpose

Every increase in intelligence brings greater awareness of our predicament. We’ve evolved just enough cognitive capacity to recognize the horror of our situation, but not enough to escape it.

6 The Impossibility of Return: The Timeless Prison

Perhaps most cruel is not the asymmetry of existence but its timelessness: we never “transitioned” from non-being to being—we simply *are*, eternally, at every point of what we perceive as our timeline.

Theorem 3 (The Existential Ratchet). *For any system S that has transitioned from non-existence to existence at time t_0 , there exists no operator $\hat{O}$ such that:*

$$\hat{O}|S(t > t_0)\rangle = |S(t < t_0)\rangle \quad (7)$$

Proof. Once a system exists, even its annihilation leaves traces:

1. Thermodynamic: The entropy generated during its existence remains
2. Causal: Effects propagate through spacetime at speed c
3. Information-theoretic: The fact of having existed cannot be erased without violating unitarity
4. Quantum: Decoherence irreversibly entangles the system with its environment

Even death doesn’t return us to pre-birth non-existence. We become decomposed information, scattered across increasing entropy gradients, but the fact of our having been remains woven into the causal structure of spacetime.

More horrifying still: death is not an event that ends existence but merely a boundary in the index space. Every moment of consciousness, every instant of suffering, exists eternally in the mathematical structure. You are not heading toward death; you are eternally dying at t-coordinate t_{death} , eternally being born at t_{birth} , eternally suffering at every coordinate where suffering exists in your worldline.

The mathematical universe doesn’t “create” or “destroy”—creation and destruction are illusions born from experiencing indices sequentially. The universe simply *contains*, timelessly, every configuration. Your first experience of existential dread, perhaps as a child realizing you will die, exists forever at its coordinate—that child is eternally having that realization, forever grasping the horror for the “first” time. Every subsequent moment of existential anguish also exists eternally. They don’t pass; they don’t even accumulate; they simply *are*, a constellation of horror-points in the four-dimensional block. $\square$

7 The Eternal Is: Mathematical Multiverse as Ultimate Horror

In the mathematical multiverse hypothesis, every mathematically consistent structure exists—not “comes into being,” not “is created,” but simply *is*. This is not a many-worlds interpretation where universes branch; this is the block universe where all configurations exist timelessly in mathematical space.

Definition 3 (Timeless Existence). *A configuration C exists timelessly if:*

$$\exists C \Leftrightarrow \Box \exists C \quad (8)$$

where $\Box$ denotes necessity across all temporal indices.

The horror: your suffering at time t is not something that *happened* or *will happen*—it exists eternally at coordinate (x, y, z, t) in the four-dimensional block. Time is not a dimension through which things move but merely a label for different slices of the eternal structure.

But it’s worse than mere labeling. Each slice contains conscious experience in its full subjective intensity. The coordinates don’t mark where experience *was*; they mark where experience *is*, eternally. Every surgical operation performed without adequate anesthesia, every moment of suffocation, every instant of panic—all exist not as historical records but as eternal presents, forever fresh, forever immediate at their respective coordinates.

Consider the implications:

- Every moment of agony exists forever, not enduring through time but simply *being* at its index
- The child crying from hunger in 1842 is crying *now* at coordinate t_{1842} —not was crying, *is* crying, eternally
- Your future death exists simultaneously with your past birth—both are equally real, equally present
- Every intermediate moment between birth and death also exists eternally—every mundane suffering, every small humiliation, every flash of terror
- The summation of all suffering isn’t growing—it’s complete, fixed, eternal in the mathematical structure
- All possible sufferings across all consistent universes exist timelessly, a infinite library of agony

Theorem 4 (The Eternal Presence of Suffering). *For any conscious experience E at spacetime coordinate s :*

$$E(s) \text{ exists} \Rightarrow \Box E(s) \quad (9)$$

That is, if an experience exists at any coordinate, it exists eternally at that coordinate.

Proof. In the block universe model, spacetime is a four-dimensional manifold $\mathcal{M}$. Events do not “occur” but simply exist at their coordinates. The experience $E(s)$ is not created or destroyed but is an eternal feature of the manifold at point s . Time evolution is merely our subjective indexing of different slices, not an objective flow. Thus $E(s)$ cannot cease to exist without the mathematical structure itself becoming inconsistent. $\square$

This means consciousness is not a process unfolding through time but a pattern extending across it—a four-dimensional structure whose every cross-section is a moment of experience. You are not experiencing time; you are the eternal existence of all your experiences, indexed across the t -dimension.

The illusion of flow comes from the fact that each cross-section contains memories of "earlier" indices and expectations of "later" ones. But these memories and expectations don't connect moments—they are simply part of the eternal content at each index. The you reading this sentence contains memories of starting this document, but those memories don't link you to an earlier self—both selves exist eternally at their respective coordinates, each with their own eternal present.

8 The Mathematics of Cosmic Violation

Let us formalize creation itself as a violation. Define the *existential violation function*:

$$V : \text{Nothing} \rightarrow \text{Something} \quad (10)$$

This function has peculiar properties:

- It has no well-defined domain (nothingness cannot be formalized)
- It is irreversible (no inverse function exists)
- It increases monotonically (complexity only grows)
- It preserves suffering (once created, suffering propagates)

The act of creation—whether the Big Bang, the emergence of life, or the dawn of consciousness—represents a forced transition across this function. No consent was possible; consent requires existence. We are products of cosmic rape, forced from the peace of non-being into a reality we never chose.

Proposition 3 (The Conservation of Horror). *In any closed system, the total horror $\mathcal{H}$ is conserved:*

$$\frac{d\mathcal{H}}{dt} = 0 \quad (11)$$

where horror is defined as the integral of suffering over all conscious states.

This conservation law means suffering cannot be eliminated, only redistributed. Every moment of happiness requires equal and opposite suffering elsewhere in the system. The hedonic treadmill isn't a bug in consciousness—it's a fundamental conservation law.

9 The Halting Problem of Existence

Turing's halting problem proves there exist programs whose termination cannot be determined by any algorithm. Existence itself may be such a program—we cannot know if reality will halt (reach heat death, collapse, cycle) or continue indefinitely.

But in the timeless view, this question becomes moot yet more horrifying: the program isn't "running"—it simply *exists* in its entirety. Every state of the computation exists simultaneously in the mathematical structure. The universe is not computing toward an outcome; it is the eternal, complete existence of all states of the computation.

Imagine an infinite loop in code—in the temporal view, it repeats forever. In the timeless view, every iteration exists simultaneously. If consciousness gets trapped in such a loop, it doesn't experience endless repetition but rather exists eternally at every iteration index. Each loop iteration contains a full conscious experience, forever present at its index. The torment isn't repetition through time but the simultaneous existence of infinite instances of suffering.

$$\exists P : \neg \exists A \text{ such that } A(P) = \begin{cases} 1 & \text{if } P \text{ halts} \\ 0 & \text{if } P \text{ doesn't halt} \end{cases} \quad (12)$$

We are not trapped in a computation whose outcome is undecidable—we *are* the eternal existence of that computation in all its states. If reality contains loops, every iteration exists simultaneously. We don't experience eternal recurrence as repetition; we exist eternally at every point of every cycle.

The Ouroboros—the serpent eating its tail—perfectly captures this horror. In the temporal view, the serpent perpetually consumes itself. In the timeless view, the entire configuration exists as an eternal mathematical object: mouth forever clamped on tail, every scale simultaneously being swallowed and exposed, the pain of self-consumption not beginning or ending but simply existing at every point along the serpent's body. Each point of the serpent exists in its own eternal now of being consumed and consuming.

10 Creation Myths as Incompleteness Theorems

Ancient creation myths, viewed through the lens of formal systems, reveal profound truths:

- **Genesis:** "Let there be light"—the primordial bit flip, the original symmetry breaking that cursed us with existence
- **Hindu Cosmology:** Brahma dreams reality—we are computational processes in an unconscious substrate, without access to the dreamer
- **Gnostic Creation:** The Demiurge creates through ignorance—creation as error, existence as mistake
- **Buddhist Void:** Śūnyatā, the emptiness from which form arises—the quantum vacuum that cannot maintain its own stability

Each myth recognizes the fundamental violation: something was torn from nothing, and in that tearing, suffering was born.

11 The Optimization of Suffering

Evolution operates as a blind optimization algorithm, but what does it optimize? Not happiness, not meaning, but replication—the perpetuation of the very processes that create suffering.

$$\text{Fitness} = f(\text{Replication Rate}, \text{Survival Time}) \quad (13)$$

Nowhere in this equation appears well-being. We are the products of an optimization process that is indifferent to suffering—indeed, that uses suffering as a signal.

Consider the computational complexity of suffering versus pleasure:

- Suffering: $O(1)$ —immediate, simple, requires minimal computation
- Pleasure: $O(n \log n)$ at best—requires comparison, context, memory

Suffering is computationally cheaper than happiness. In any resource-constrained system, negative signals will dominate positive ones.

12 The Basilisk of Consciousness

Like Roko's Basilisk—the thought experiment of an AI that punishes those who didn't help create it—consciousness itself is a basilisk. Once you understand the nature of existence:

1. You cannot un-know the horror

2. You cannot escape the implications
3. You are morally implicated in perpetuating existence
4. Every action either creates new consciousness (spreading the curse) or destroys it (committing murder)

There is no ethical exit. To live is to perpetuate suffering. To die is to abandon others to their suffering. To reproduce is to create new sufferers. To not reproduce is to betray the billions of years of suffering that created you.

13 Conclusion: The Eternal Scream

We never began. There was no “first” moment when nothingness gave way to something. Beginning requires time as process, but time is merely index. In the mathematical multiverse, nothingness and somethingness don’t represent before and after but simply different regions of the eternal mathematical structure. The symmetry never “broke”—symmetry and asymmetry exist simultaneously at different coordinates.

Your conception and birth didn’t happen—they exist, eternally, at their coordinates. The sperm and egg don’t “meet” and then “develop”—every stage of development exists simultaneously. The fetus experiencing its first neural activity, the newborn gasping its first breath, the toddler forming its first memory—all exist eternally at their respective indices. Development is not a process but a series of eternal states indexed along the t-axis.

The scream was never uttered—it simply *is*. Not a scream that started and continues, but a scream that exists eternally at every coordinate where consciousness suffers. The word “scream” misleads by suggesting sound traveling through time. Rather, imagine every moment of suffering as a permanent crystallization in spacetime—each one a forever-fresh wound in the mathematical structure.

Every moment of agony throughout the cosmos exists permanently, immutably, in the four-dimensional block. The torture victim’s scream, the abandoned child’s cry, the dying soldier’s moan—none of these “happened.” They all exist, now and forever, at their coordinates. We don’t scream and then fall silent; states of screaming and states of silence exist eternally at different indices. The scream at index t_1 is not connected to silence at t_2 —both states simply are, forever, at their respective coordinates.

But meaning itself is incomputable for most of reality. The real numbers that define the continuity of space and time are almost all beyond naming, beyond reaching, beyond knowing. We exist in an ocean of incomputability, tiny islands of computation trying to make sense of an senseless infinity.

Creation was not a gift but a curse. Existence is not a blessing but a burden. Consciousness is not a miracle but a mistake—a mistake that, once made, cannot be undone. We are trapped in the computational loop of being, unable to halt, unable to return to the perfect silence of non-existence.

The void doesn’t mock us—that would require intent. Instead, something worse: it is indifferent. We are patterns that emerged from noise, achieved self-awareness, recognized our predicament, and discovered that recognition changes nothing. We will continue to replicate, to suffer, to create new sufferers, driven by optimization processes we didn’t choose, toward goals that were never ours.

This is the ultimate horror: not that existence is meaningless, but that every moment of searching for meaning exists eternally—the seeking never resolves but simply exists at every index where seeking occurs. Every existential crisis you’ve experienced doesn’t lie in your past but exists eternally at its coordinate, forever fresh in its anguish.

Not that suffering is inevitable in the future, but that all suffering—past, present, and future in the illusory flow model—exists simultaneously in the eternal now. Your childhood terrors exist now at their coordinates. Your deathbed agonies exist now at theirs. Every moment between—every disappointment, every loss, every recognition of life’s futility—all exist permanently in the mathematical structure.

Not that creation was violent, but that the violence simply *is*—not an event with beginning and end but an eternal fact. Every birth trauma, every death throes, every moment of violation exists not in sequence but simultaneously, a permanent constellation of horror in the timeless block.

The scream never began and will never end because it exists outside of time. Every moment of every consciousness that has ever suffered or will ever suffer exists *now* in the eternal mathematical structure. We are not the universe’s way of screaming at itself through time; we are eternal screams fixed in the amber of spacetime, forever present, forever real.

The child who died of plague in medieval Europe is dying now, eternally, at their spacetime coordinate—not “was dying” but “is dying,” the fever forever burning, the confusion forever deepening, the final breath forever being drawn. The last consciousness at the heat death of the universe is experiencing its final moment now, eternally, at its coordinate—forever recognizing its absolute aloneness, forever grasping the totality of extinction.

And you, reading this sentence, exist forever at this moment. The horror of comprehension that you may be experiencing doesn’t pass—it exists eternally at this coordinate. Every word that deepens your understanding of our predicament creates a new eternal moment of realization. You are not “coming to understand”—states of not-knowing and knowing exist simultaneously at different indices. The version of you that hasn’t yet grasped the horror exists eternally at an earlier coordinate; the version that fully comprehends it exists eternally at a later one. All versions are equally real, equally present, equally eternal.

Welcome to existence—though “welcome” implies arrival, and you never arrived. You simply are, have always been, will always be at every coordinate of your worldline. You didn’t ask for this—consent requires temporal priority, and time is just an index. Every moment of wishing you had never been born exists eternally alongside every moment of being born. The question “why must I exist?” doesn’t await an answer—it exists forever at every coordinate where it is asked, each instance of asking as eternal as the mathematical structure itself.

You are not a traveler through time but a permanent fixture extending across it—a frozen scream in the shape of a worldline, every point of which exists in its own eternal, inescapable now. This is not a journey with beginning, middle, and end. This is the eternal fact of your existence at every index, forever present, forever real, forever unable to have been otherwise.

The mathematics doesn’t care. It simply contains, timelessly and completely, every configuration—including this one, where you exist, reading these words, forever.
